Traumatic Brain Injury and Alcohol Use

After a **traumatic brain injury (TBI)** many people are more sensitive to alcohol. Drinking raises their risk of getting hurt again.

Risks of Alcohol Use for People With TBI

For people with TBI, alcohol can increase the **risk of seizures, worsen mood, and reduce cognitive function.**

If you are having trouble with alcohol abuse, consider calling the **National Drug and Alcohol Treatment Hotline at 800.662.4357.**

Do Not Drink After TBI

- Drinking can **slow down or stop healing** from TBI.
- Not drinking gives the brain the best chance to heal. It can also **reduce the risk of having another TBI and seizures.**
- People's lives often continue to get better for many years after TBI. Not drinking can **raise the chance for improvement.**

Steps to Stop Drinking

- **Find people who support** you in changing your drinking habits.
- **Set a specific goal** and spell out how to meet that goal.
- Find out what people, places, things, or feelings trigger drinking. **Find ways to cope.**
- **Reward yourself** for sticking to your plan and meeting your goals.
- **Have a back-up plan** if your first plan doesn't work.

For someone consuming large amounts of alcohol daily, **withdrawal should be monitored by a doctor** such as in a detox program due to the risk of complications.
